

**EQUIPMENT & SERVICES FOCUS**

■ The latest version of a filling level control system from Parmacontrols has recently been installed on a canning line at Italia Meal's plant at Castel San Giorgio in Italy. The line fills 73mm diameter three-piece food cans.

The ControlLevelXR x-ray technology checks fill levels and is particularly suitable for canning lines with rotary retorts, which require cans to be precisely filled for a smooth operation.

ControlLevelXR is energy-efficient as it requires a lower cooling temperature. The product's most critical components are designed to last longer due to the updated detector and software-controlled x-ray generator that ensures the machine only operates at maximum power when the containers are in the measuring bridge.
